

A exact regular-torsor ledger**B retained order does not identify q** **C exact scalar pairs: cell = (support, exponent)**

$\kappa(\text{point})$	(3,1)*	(4,2)	(10,2)	(8,6)	(5,20)	(3,4)	(12,2)	(12,6)	(30,2)
$\Phi(\text{point})$	(3,1/3)	(4,1/4)	(10,1/10)	(8,1/8)	(5,1/5)	(3,1/3)	(12,1/12)	(12,1/12)	(30,1/30)
$\kappa(\text{orbit})$	(1,3)	(1,8)	(1,20)	(1,48)	(1,100)	(1,12)	(1,24)	(1,72)	(1,60)
$\Phi(\text{orbit})$	(1,1)	(1,1)	(1,1)	(1,1)	(1,1)	(1,1)	(1,1)	(1,1)	(1,1)
	$q = 2$	$q = 3$	$q = 5$	$q = 7$	$q = 11$	$q = 4$	$q = 6$	$q = 9$	$q = 10$

* $q = 2$: sole locked row/type pair with source support and unit exponent; no family-uniform starred column.

$q = 2$ gives (3,1)*, but $r_2 = r_4 = 3$: the sole exception is not modulus-specific.
