

active geometry

TR breaking

Radial exponential clock

$$V_0(u) = 2\pi e^{\pi|u|^2}$$

$$|\{\pi|u|^2 < t\}| = t$$

Hénon configuration warp

$$V_{a,n}(q) = V_0(\tilde{H}_a^n(q))$$

$\det D\tilde{H}_a^n = 1$ preserves sublevel area

Magnetic symmetry control

$$\frac{1}{2}|-i\nabla - A_B|^2 + V_{a,n}$$

$p \mapsto p - A_B(q)$ preserves fiber area

Invariant mean clock: $\mathcal{N}_{\text{cl}}(E) = \frac{E}{2\pi} \log \frac{E}{2\pi} - \frac{E}{2\pi} + 1$
