

Exact Hénon specialization

no periodic equation solved

Map, one-form, and sign

$$H_a(q, p) = (q^2 - a - p, q)$$

$$\det DH_a = 1$$

$$G = \frac{2}{3}q^3 - pq, \quad L_a|_{\Gamma_H} = -G$$

five exact residuals = 0

Cyclic recurrence

$$q_{j+1} + q_{j-1} = q_j^2 - a$$

period 1: both neighbor slots are q_0

period 2: both slots are q_1 (and vice versa)

ordered-slot multiplicity: PASS

All-period algebraicity ledger

audited periods: 1, 2, 3, 5

at $Z = 0$: every leading equation is $Q_j^2 = 0$

all projective coordinates forced zero

dimension implication:

finite affine periodic scheme

Valuation and denominator ledger

outside S : $R^2 \leq R$ forbids $R > 1$

certified: $3\mathcal{A}_G \in \mathcal{O}_{K,S}$

denominator support: $\{3\}$

sharp control: $a=-1$, $P=(1, 1)$, action=-1/3

ALGEBRAIC NORMALIZED ACTION CLOCK REJECTED BY ALL PERIOD THEOREM
